

What is Tadalafil/Oxytocin/PT-141 Combination - Oral Troche?

Tadalafil is a proven ED medication and its effects are cumulative and improve with daily use. It's effective for both male and females. It not only increases nitric oxide in the corpus cavernosum of men, but in women it also results in the relaxation of clitoral and vaginal smooth muscle and increased blood flow in these sites, a normal step in arousal and necessary to achieve orgasm.

Oxytocin is well known as the 'love hormone' because of how it increases with touch and stimulation. This powerful hormone plays a huge role in relationships and how we partner with others. Exogenous administration of oxytocin can improve libido, organism intensity/frequency and overall sexual pleasure for both males and females.

PT-141 works on the central nervous system to directly induce an increase in libido and induce erections. It works in 80% of men who don't respond to PDE5 inhibitors and most will now use it as a first line therapy. It is FDA approved for women and it increases sexual gratifying experiences by 50%.

Patient Benefits:

- Effective for both males and females
- Increase sexual desire, sexual arousal, sexual orgasm and sexual satisfaction
- Easy oral administration
- Taken daily, will allow for a natural and spontaneous sexual experience with no waiting on a pill or injection to take effect
